EDUCATION

Jabalpur Engineering College — Jabalpur, MP
Bachelor of Technology – Artificial Intelligence and Data Science — *Aug 2025 – Jun 2029*

Standing: Second Year (Sophomore)

Stemfield International School — Jabalpur, MP
Higher Secondary Education – Mathematics and Computer Science — *Apr 2011 – Mar 2025*

TECHNICAL SKILLS

Languages: Python, C, C++, Java, Go, SQL, R
Backend: FastAPI, REST APIs, WebSockets, WebRTC, SQLAlchemy
Databases & Storage: MySQL, PostgreSQL
Machine Learning: PyTorch, TensorFlow, Scikit-learn, NumPy, Pandas
Engineering: Linux, Git, GitHub, Docker, GitHub Actions

PROJECTS

NeuralFabric: Machine Learning Framework from Scratch | *Python, NumPy*

- Built a modular machine learning framework from first principles using Python and NumPy, implementing tensor operations, reverse-mode automatic differentiation, and foundational regression models.
- Developed numerical-gradient tests with Pytest to validate autograd correctness, enforced static typing with MyPy, and structured the project for open-source distribution with modern Python packaging and GitHub Actions.

DoorDarshan: Real-Time Video Conferencing Platform | *FastAPI, WebSocket, WebRTC*

- Engineered a real-time video conferencing platform using FastAPI, WebSockets, and browser-native WebRTC for live audio/video communication, screen sharing, and peer signaling.
- Implemented JWT-authenticated meeting rooms, participant management, in-meeting chat, and meeting scheduling with PostgreSQL persistence using SQLAlchemy and Alembic.

Kryptika: Blockchain in Pure Python | *ECDSA, P2P, HTTP*

- Implemented a blockchain from scratch in pure Python, covering SHA-256 hashing, Proof of Work, ECDSA-signed transactions, transaction validation, and longest-chain consensus.
- Engineered P2P networking, persistent mempool and blockchain storage with SQLite, thread-safe HTTP communication, and a browser-based dashboard with a visual chain explorer.

Timeless: Decoder-Only Transformer Language Model | *PyTorch, Transformers*

- Built a decoder-only Transformer language model from scratch in PyTorch, implementing tokenization, causal self-attention, multi-head attention, residual connections, and normalization.
- Developed an end-to-end LLM workflow covering pretraining on unlabeled text, model checkpointing, text-classification fine-tuning, and instruction tuning for downstream tasks.

AdityaL1-MAG: Solar Magnetic Field Analysis | *Python, Signal Processing*

- Developed a data-analysis pipeline for ISRO's Aditya-L1 MAG observations, including data ingestion, filtering, and visualization of spacecraft magnetic-field measurements.
- Performed magnetic-field characterization and exploratory analysis to identify patterns and variations in the observed environment.

AWARDS & HONOURS

Machine Learning Specialization | *DeepLearning.AI* — Jul 2026

- Completed coursework covering supervised learning, neural networks, model optimization, and regularization.

Finalist, RAGNAROK Hackathon | *Google Developer Groups (GDG)* — Jan 2026

- Selected as a finalist in a competitive hackathon for technical problem-solving and rapid project development.
